DISCS

Position

- ▶ You already know how to set an object's position
- ▶ Which also means you already know how to change an object's position
 - ▶ In response to player input
 - ▶ Automated part of program loop

001010100101010001111001101010010101
10001100100001111001101010010101
11001010101010100001001100101010100
100101001001001010101010101010101
11100001111010110000000111101001
00100101010010100100101001001010110
1001010010001010100100101001010
100101001010100101001010010101

DISCS

Warning

- ▶ You have been exposed to enough code that I am now assuming that I don't have to explain each and every code detail:
 - ▶ Programming conventions (ex. a variable in all caps is a constant or some pre-defined value)
 - ▶ Undeclared variables (ex. copy-pasting slide code will require you to "fill in the blanks")

Some Adjustments

- Since we'll eventually be dealing with collisions, we need to modify our CircleShapes:

```
// assuming all CircleShapes
```

```
// have the same radius
```

```
anyCircle.setOrigin( RADIUS, RADIUS );
```

```
anyCircle.setRadius( RADIUS );
```

0010101001010100001111001101010010101
11001010101010100001001100101010100
100101001001001010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110
1001010010001010100100101001010
100101001010100101001010010101

Some Adjustments

- ▶ Position is already handled, but what about velocity and acceleration?
 - ▶ Each shape must have its own “current” velocity and “current” acceleration
 - ▶ How do we represent velocity?
 - ▶ Hint: Similar to Position!
 - ▶ How do we represent acceleration?
 - ▶ Hint: Similar to Velocity!

0010101001010100011110100001100
10001100100001111001101010010101
110010101010100001001100101010100
1001010010010010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110
10010100100001010100100101001010
10010100101010010100101001010101

Time is Money

- ▶ You will also need a global constant representing your program's time step
 - ▶ Everything has to be scaled according to this value
 - ▶ By default, this should be equal to a frame's "time" in seconds

```
#define TIMESTEP      1.0f / FPS
#define FORCE          10000.0f * TIMESTEP
```

“Moving” an Object

- ▶ To move an object in real life:
 - ▶ Apply a force on the object
 - ▶ This causes the object to accelerate
 - ▶ Which changes the object's velocity
 - ▶ Which changes the object's position

0010101001010100001111001101010010101
10001100100001111001101010010101
11001010101010100001001100101010100
100101001001001010101010101010101
11100001111010110000000111101001
0010010101001010010010100100100110
10010100100001010100100101001010
100101001010100101001010010101

DISCS

Bare Minimum

- ▶ If we didn't care about realistic physics:
 - ▶ Check for anything changing acceleration
 - ▶ Determine current acceleration
 - ▶ Add acceleration to current velocity
 - ▶ Add current velocity to position
- ▶ Simple to understand and easy to implement, but not realistic
 - ▶ It's close, though!

001010100101010001111001101010010101
110010101010100001001100101010100
1001010010010010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110
10010100100001010100100101001010
1001010010101001010010101010101

Massive Force

- ▶ Force = Mass * Acceleration
 - ▶ How do we represent an object's mass?
 - ▶ To keep things simple, we will be using *rigid body* physics
 - ▶ Sort of like billiard balls
 - ▶ Any number of forces can be acting on an object
 - ▶ They can have different directions, too

001010100101010001111001101010010101
10001100100001111001101010010101
110010101010100001001100101010100
1001010010010010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110
1001010010001010100100101001010
100101001010100101001010010101

DISCS

Acceleration

- ▶ By default, an object is not accelerating
- ▶ Check for sum of all force vectors then compute for acceleration from there

```
// acceleration initialization here - what should go here?  
// process input for forces - but this is not quite correct?  
if( sf::Keyboard::isKeyPressed( keyRight ) )  
{  
    playerAccel.x += FORCE / MASS_PLAYER;  
}  
  
if( sf::Keyboard::isKeyPressed( keyUp ) )  
{  
    playerAccel.y -= FORCE / MASS_PLAYER;  
}
```

001010100101010001111001101010010101
11001010101010100001001100101010100
100101001001001010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110
1001010010001010100100101001010

DISCS

Velocity and Position

- After that, it's a simple matter of applying physics:

```
float t = TIMESTEP;
```

```
sf::Vector2f pos = circle.getPosition();
```

```
pos = ???;           // what should go here?
```

```
circleVel = ???;     // what should go here?
```

0010101001010100001111001101010010101
10001100100001111001101010010101
11001010101010100001001100101010100
100101001001001010101010101010101
11100001111010110000000111101001
001001010100101001001010010010110

100101001010100101001010010101

Velocity and Position

- After that, it's a simple matter of applying physics:

```
float t = TIMESTEP;
```

```
sf::Vector2f pos = circle.getPosition();
```

```
pos += circleAccel * (0.5f * t * t)
      + (circleVel * t);
```

```
circleVel += (circleAccel * t);
```

0010101001010100001111001101010010101
11001010101010100001001100101010100

100101001010100101001010010101
```

DISCS

Elasticity

- ▶ Some objects bounce, some don't
 - ▶ Particularly important if you have some kinematic surface acting as a floor or wall
- ▶ It depends on your elasticity coefficient
 - ▶ 0 = Splat
 - ▶ 1 = Boing
 - ~~▶ In-between = Sploing?~~

0010101001010100011110100001100
10001100100001111001101010010101

1001010010101010010100101010101

DISCS

Elasticity

- ▶ Assuming rigid body dynamics, you also have to account for penetration

- ▶ Two shapes, after movement, may be overlapping (aforementioned penetration)

Elasticity

- This means either adjusting the object's position upon impact or only applying the collision response if the object is indeed moving towards a surface

```
// assuming an object hitting the floor
// note: this isn't treated like a force
// (more on that when we get to impulse)
circleVel.y = -ELASTICITY * (circleVel.y);
```

001010100101010001111001101010010101
